Object-oriented Matlab in the second DAFx Book:

DAFX: Digital Audio Effects - 2nd Edition, 2011

Free software download from www.dafx.de:

- Click on “DAFX - Digital Audio Effects (Second Edition)” in the upper-right corner of the main DAFx website www.dafx.de
- Click on “Matlab Files”
- Click on “Matlab for Chapter 12”
- Open “WDFDiodeExample.m”
- Try it out in Matlab or Octave!
- License as of 2015-11-28:

“It may be used for educational purposes and not for commercial applications without further permission.”

DAFx-Book Wave Digital Filter Software, Continued

Object-oriented Matlab for a simple WDF diode circuit:

- Influential but not Complete:
- Includes:
 - Wave-digital capacitor and resistor
 - Series three-port adaptor
 - Binary Connection Tree
- Left as an exercise for the reader:
 - Parallel adaptors
 - Inductors
 - Memoryless nonlinearity
 - Adapted voltage source
- Not yet known at the time:
 - R-node scattering junctions
 - Multiple nonlinearities

WDF Framework C++

Real-Time WDF Demo

DAFx Book Matlab: WDFDiodeExample.m

```
...
% Build the circuit:
V1 = V(0,1); % voltage source with 0 initial voltage & 1-Ohm resistor
R1 = R(80); % 80 Ohm resistor R1
CapVal = 3.5e-5; % capacitance value in Farads
C1 = C(1/(2*CapVal*Fs)); % Capacitor C1
s1 = ser(V1,ser(C1,R1)); % WDF tree = series connection of V1,C1,R1
Vdiode = 0; % initial value for the voltage over the diode

% Simulation loop:
for n = 1:N % n = time in samples
    V1.E = input(n); % input signal = voltage source
    WaveUp(s1); % propagate waves from leaves to root of WDF tree
    Rdiode = 125.56*exp(-0.036*Vdiode); % diode = nonlinear resistor
    r = (Rdiode-s1.PortRes)/(Rdiode+s1.PortRes); % dynamic reflectance
    s1.WD = r*s1.WU; % wave leaving the diode (at root of WDF tree)
    Vdiode = (s1.WD+s1.WU)/2; % current diode voltage
    output(n) = Voltage(R1); % output = voltage across resistor R1
end;
```

DAFx Book Matlab: WDFClasses.m

```

WDF Framework C++

Real-Time WDF Demo

C++ inspired by the DAFx-book, posted to the JUICE Forum under “Useful Tools and Components” by maxprod:

<http://www.juce.com/forum/topic/wave-digital-filter-wdf-juce/>

<http://www.juce.com/forum/topic/->

[wdf-new-restructuration-project-audio-processor](http://www.juce.com/forum/topic/wdf-new-restructuration-project-audio-processor)

(Search the JUICE Forum for 'WDF')

- Compiles and runs on Mac OS X after changing Build Settings to use OSX SDK 10.9 instead of 10.10 (else “Point” not defined)
- Should work on Linux and anywhere else supported by JUICE (AU, VST, . . .)
- Nice hierarchical object-oriented class structure (like the Matlab example from DAFx Book II)
- Suitable for real-time deployment (unlike Matlab code)
- Similarly needs upgrades

Copyright license is unclear:

- The word “copyright” does not appear anywhere in the Source
- In the second JUCE Forum post, maxprod says

“Feel free to use the WDF++ project, it’s for the humanity benefice.”

A definite copyright choice would be preferred!

It is probably safest to treat the JUICE Forum code from maxprod as GNU GPL, since this is typical for JUICE modules:

- `README.txt` for the JUICE Library, downloaded 2014-12-13 from <http://www.juce.com>:

“Most JUICE modules are shared under the GNU Public Licence (GPLv2, v3, and the AGPLv3). This means that the code can be freely copied and distributed, and costs nothing to use in other GPL applications. One module (the `juce_core` module) is permissively licensed under the ISC.”

- Could JUICE Forum posts have an implied copyright license?

Preferred License = MIT

*Opinion: **MIT License** is the best choice*

- Anyone can use the software for whatever, even at companies
- We can fully share our software, even in our consulting work
- Companies don't have to disclose it (marketing decision)
- Bugs more likely to be found and fixed
- One can supplement the MIT License to request (nonbinding) contribution of bugfixes and general-purpose extensions

FAUST License \approx MIT

WDF Framework C++

Real-Time WDF Demo

The FAUST project licenses are generally close to the MIT License:

- Enables companies to use *and contribute to* the FAUST project
- FAUST's consulting-compatible licensing led to many contributions in
 - `oscillator.lib`
 - `filter.lib`
 - `effect.lib`
- **Reason:** Companies can easily afford to contribute
 - bugfixes and incremental extensions
 - *not* total rewrites from scratch

JUCE WDF Code: DiodeWDF.h: Build and Run Diode Circuit in C++

```
...
//Build Circuit:
VoltageSource Vin(0, 1); // initial voltage 0V, source R = 1 Ohm
Resistor R1(80.0);
Capacitor C1(3.5e-5, Fs); // Cap. & Inductor need sampling rate Fs
Series RC(&R1, &C1); // R1 and C1 are connected in series
Series root(&Vin, &RC); // Voltage src and RC ckt also in series
...
//Simulation Loop:
for (int n=0; n<max; n++) { // for each time sample
    Vin.Vs = input[n]; // input signal -> voltage source
    b = root.reflected(); // propagate waves from leaves to root
    Rdiode = Is * exp(-Vt * Vdiode); // diode resistance (FIXME)
    r = (Rdiode - root.R) // update dynamic diode reflectance
        / (Rdiode + root.R); // (still have an extra sample of delay)
    root.incident(r * b); // reflected wave from diode (at root)
    Vdiode = root.voltage(); // update current diode voltage
    output.add(R1.voltage()); // output = voltage across resistor R1
}
return output;
...
```

JUCE WDF Code (WDF.h) WDF Class

```
class WDF { // Every element and every adaptor is a subclass of WDF
public:
    WDF (double Rp, std::string varName="WDF")
        : R(Rp), G(1/Rp), a(0), b(0), name(varName) {}

    virtual inline double reflected () = 0; // pure virtual function
    virtual inline void incident (double value) = 0; // (WDF abstract)

    double voltage () { // v
        return 0.5 * (a + b); // so traveling voltage-waves are a/2, b/2
    }
    double current () { // i
        return 0.5 * (a - b) * G; // (vp-vm)/R in waveguide variables
    }
    double R; // WDF port resistance (top port for adaptors)
    double G; // conductance G = 1/R = inverse port resistance
    double a; // incident WDF wave variable (incoming voltage wave * 2)
    double b; // reflected WDF wave variable (outgoing voltage wave * 2)
    std::string name; // same as the variable name used, for debugging
}
```

JUCE WDF Code (WDF.h) Resistor

```
class Resistor : public WDF {  
  
public:  
  
    Resistor (double R, std::string varName="R") : WDF (R,varName) {}  
  
    virtual inline double reflected () {  
        b = 0;  
        return b;  
    }  
  
    virtual inline void incident (double value) {  
        a = value;  
    }  
  
}
```

JUCE WDF Code (WDF.h) Short Circuit

```
class ShortCircuit : public WDF {
public:
    ShortCircuit (double R) : WDF (R) {}
    virtual inline double reflected () { // tree evaluation to root
        b = -a; // a = incoming voltage wave / 2
        return b; // voltage waves sign-flip when reflecting from a short
        // Note one-sample delay: a was written a sample ago
    }
    virtual inline void incident (double value) {
        a = value; // set when pushing down the tree from the root
    }
}
```

Better to use an *adapted* “approximate short-circuit” here:

- Retain microscopically small resistance $R = \epsilon$
- Set the connecting adaptor port resistance to ϵ
- Inverting reflection now happens at the adaptor
- No reflection from the near-short-circuit itself

JUCE WDF Code (WDF.h) Open Circuit

```
class OpenCircuit : public WDF {
public:

    OpenCircuit (double R)
        : WDF (R) {}

    virtual inline double reflected () {
        b = a;
        return b;
    }

    virtual inline void incident (double value) {
        a = value;
    }
}
```

JUCE WDF Code (WDF.h) Voltage Source

```
class VoltageSource : public WDF {
public:

    VoltageSource (double V, double R, std::string varName = "Vs")
        : Vs (V), WDF (R, varName) {}

    virtual inline double reflected () {
        b = -a + 2.0 * Vs;
        return b;
    }

    virtual inline void incident (double value) {
        a = value;
    }

    double Vs;
}
```

JUCE WDF Code (WDF.h) Current Source

```
class CurrentSource : public WDF {
public:

    CurrentSource (double I, double R, std::string varName="Is")
        : Is (I),
          WDF (R,varName) {}

    virtual inline double reflected () {
        b = a + 2.0 * R * Is;
        return b;
    }

    virtual inline void incident (double value) {
        a = value;
    }

    double Is;
}
```

JUCE WDF Code (WDF.h) Capacitor

```
class Capacitor : public WDF {
public:

    Capacitor (double C, double T, std::string varName="C")
        : WDF (T/2.0*C, varName),
          state (0) {}

    virtual inline double reflected () {
        b = state;
        return b;
    }

    virtual inline void incident (double value) {
        a = value;
        state = value;
    }

    double state;
}
```

JUCE WDF Code (WDF.h) Inductor

```
class Inductor : public WDF {
public:

    Inductor (double L, double T, std::string varName="L")
        : WDF (2.0*L/T,varName),
          state (0) {}

    virtual inline double reflected () {
        b = -state;
        return b;
    }

    virtual inline void incident (double value) {
        a = value;
        state = value;
    }

    double state;
}
```

JUCE WDF Code (WDF.h) WDF Adaptor Class

```
class Adaptor : public WDF {
public:
    WDF *left;    // WDF element connected at the left port
    WDF *right;   // WDF element connected at the right port

    Adaptor (WDF *l, WDF *r, double R, std::string varName)
        : left (l), right (r), WDF (R, varName) {}

    virtual inline double reflected () = 0;

    virtual inline void incident (double wave) {
        // set the waves to the children according to the scattering rules
        left->incident ( left->b - ( left->R / R
                               * (wave + left->b + right->b));
        right->incident (right->b - (right->R / R
                               * (wave + left->b + right->b));

        a = wave;
    }
}
```

JUCE WDF Code (WDF.h) Series Adaptor

```
class Series : public Adaptor {
public:
    Series (WDF *l, WDF *r, std::string varName="SeriesAdaptor")
        : Adaptor (l, r, (l->R + r->R), varName) {}
    virtual inline double reflected () {
        b = -(left->reflected() + right->reflected());
        return b;
    }
}

class Parallel : public Adaptor {
public:
    Parallel (WDF *l, WDF *r, std::string varName="ParallelAdaptor")
        : Adaptor (l, r, (l->R * r->R / (l->R + r->R)), varName) {}
    virtual inline double reflected () {
        b = (left->G/G) * left->reflected()
            + (right->G/G) * right->reflected();
        return b;
    }
}
```

Real-Time WDF Demo

“Coming soon” is the Wave Digital Filter Framework:

- Written in C++ at CCRMA by Visiting Researcher Maximilian Rest from TU Berlin
<m.rest@mailbox.tu-berlin.de>
- Assistance from CCRMA MA/MST student Ross Dunkel
- Includes support for general R-node scattering matrices
- Soon to be released as Free Open-Source Software (FOSS) under a suitable license

WDF Framework Adapted Voltage Source

- An *adapted* voltage source has a source resistance equal to the resistance of its attached WDF adaptor port
- This results in *no reflection* from the voltage source, so it can be at any leaf node of the WDF tree

```
class wdfResVolt : public wdfLeaf {
public:
    double Vs;          // Voltage-source voltage
    double RSer;        // Voltage-source internal resistance
    const double Rp;    // Resistance of attached port

    inline wdfResVolt (double Vs, double RSer)
        : Vs (Vs), Rp (RSer), RSer (RSer), wdfLeaf (0) { }
    inline double calculateUpRes(double T) { return Rp; }
    inline double calculateUpB(void) { return Vs; }
    inline void calculateDownB(double wave) { } // incoming wave absorbed
};
```

WDF Framework R-Node

```
class wdfRootRtype : public wdfRoot {
public:
    int num_ports;
    double (**S);
    inline wdfRootRtype (std::vector<wdfNode*> childNodes)
        : wdfRoot (childNodes), num_ports (childNodes.size()) {
        upPort = NULL;
    }

    inline void initScatterMatrix(double (**S)) {
        this->S = S;
    }

    inline double calculateUpB(void) {
        fprintf(stderr, "*** wdfRootRtype: call processWaves()\n");
    }

    inline void processWaves(void) { ... <next slide> ... }
};
```

WDF Framework R-Node, Continued

```
class wdfRootRtype : public wdfRoot {
public:
    ...
    inline void processWaves(void) {
        int i = 0; // row index for R-node scattering matrix S(i,j)
        int j = 0; // col index for R-node scattering matrix S(i,j)
        double b = 0; // outgoing wave variable
        for (wdfPort* dpb : downPorts) {
            b = 0;
            j = 0;
            for (wdfPort* dpa : downPorts) {
                b += dpa->a * S[i][j]; // scattering mtx times incoming waves
                j++;
            }
            dpb->b = b; // outgoing wave on i'th output port
            i++;
        }
    }
};
```

The Tube Screamer is a classic distortion unit:

- The Tube Screamer C++ WDF requires around **12% CPU** at a 44.1 kHz sampling rate on an iPad 3
- Contains one nonlinearity (two diodes) — no R-nodes

Following is a demonstration of a C++ WDF Tube Screamer using the upcoming app **GeoShred** for iPad

Conclusions

[Real-Time WDF Demo](#)

- [WDF Live Demo](#)
- [Conclusions](#)

Experience to date indicates:

- Wave Digital Filters (WDFs) are an excellent choice for accurate real-time digital modeling of analog audio effects
- Computational performance and accuracy are highly competitive with other approaches
- A C++ class hierarchy is a clear and natural choice of software organization
- The *Binary Connection Tree* (BCT) implementation of WDFs requires only three-port WDF *adaptors*
- Extending BCTs to include more general scattering matrices (for R-type nodes such as bridge circuits) works out fine
