#### Time horizon and valuation Case E39 Søgne-Ålgård

Nicolai Heldal, Partner Vista Analyse AS Norway

The 5th Concept Symposium on Project Governance Valuing the Future - Public Investments and Social Return 20. – 21. September 2012

Symposium web-site: <a href="http://www.conceptsymposium.no/">http://www.conceptsymposium.no/</a> Concept Research Programme: <a href="http://www.concept.ntnu.no/english/">http://www.concept.ntnu.no/english/</a>

#### Concept

# Time horizon and valuation Case E39 Søgne-Ålgård

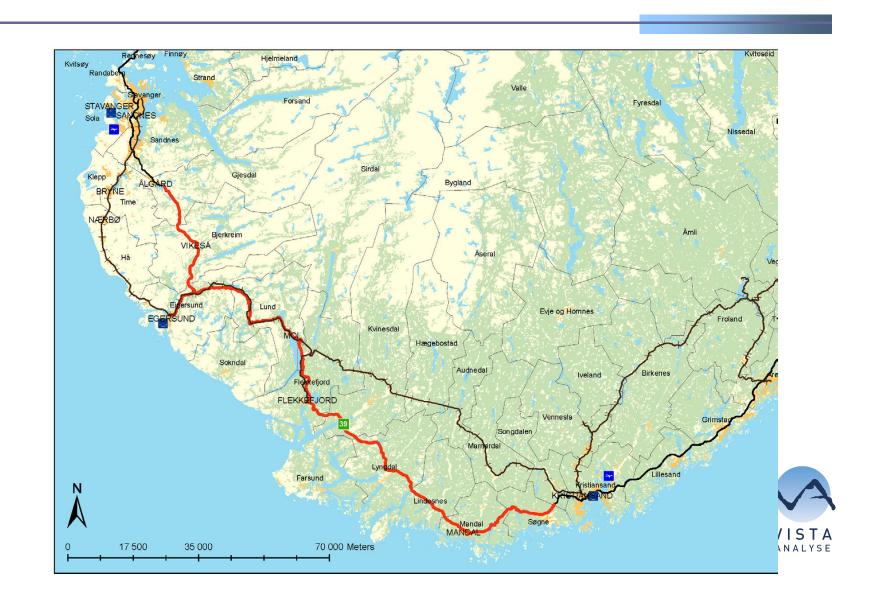

Nicolai Heldal Vista Analyse AS 20.09.2012

# E39 Søgne-Ålgård – brief introduction

- E39 between Søgne in Vest-Agder and Ålgård in Rogaland.
- 190 km long, part of the main road connecting the west coast of Norway
- Passes ten municipalities and connects the two urban regions Nord-Jæren and the Kristiansand region
- Project trigging needs:
  - Shorter travel time and more efficient transport between Nord Jæren and the Kristiansand region
  - Reduction in the frequency of serious accidents related to oncoming traffic and driving off the road

### Søgne-Ålgård

#### Benefits and costs

- Travellers and transport users
  - Shorter travel time
  - Reduction of expected delays
- Public finances
  - Investment costs
  - Operation and maintenance costs
  - Tax income
- Benefits for the society as a whole
  - Reduced accident costs

### Time horizon and valuationstarting points

- The time profile differs between the various costs and benefits
- Valuation of costs and benefits at different points of time is crucial for the profitability of a project

### What affects valuation of costs and benefits in the future?

- 1. For how long do the benefits occur?
  - a. Evaluation period
  - b. Lifetime of the investment
- 2. How do we compare benefits and costs at different points in time?
  - a. Discount rate/risk equivalents
  - b. Real price adjustment
  - c. Volume growth

## Evaluation period and technical liftime

- Evaluation period
  - For how long do the benefits from the project continue?
- Technical lifetime of the investment
  - For how long do the physical facilities last, assuming the current level of maintenance?

#### Residual values and reinvestments

- Differences between evaluation periods and technical lifetime must be handled through reinvestmensts and rest values
- Evaluation period> technical lifetime
  - reinvestment
- Evaluation period< technical lifetime</p>
  - residual value

## Evaluation period and technical lifetime KVU and KS1

| Assumption         | KVU                      | KS1                      |
|--------------------|--------------------------|--------------------------|
| Evaluation period  | 25 years                 | TS og U: 25 years        |
|                    |                          | V, M og F: 75 years      |
| Technical lifetime | 40 years                 | 40 (+40) years           |
| Rest value         | Net present value of a   | Net present value of a   |
|                    | calculated share (15/40) | calculated share (5/40)  |
|                    | of the original          | of the original          |
|                    | investment, based on     | investment, based on     |
|                    | the number of years      | the number of years      |
|                    | remaining after the      | remaining after the      |
|                    | evaluation period        | evaluation period (close |
|                    |                          | to zero)                 |
| Reinvestment       | None                     | After 40 years           |

### Real price adjustment

- Valuation of benefits is affected by income level
  - Real wage is used as indicator
- Different benefits and costs are affected differently
  - Handled through income elasticities

## Real price adjustment KVU og KS1

- KVU: No real price adjustment
- KS1:
  - Real price adjustment of 1.6 per cent per year (based on official prognoses)
  - Elasticities
    - Business travel 1.0
    - Other travel 0.8
    - Environment and accidents 1.0
    - Investment, operation and maintenance costs :
       1.0 (levelled out by higher productivity)

### Discount rate and risk equivalents

- Depends on systematic risk
- Lower in the long term?

## Discount rate and risk equivalents – KVU and KS1

- KVU:
  - Discount rate 4,5 per cent
- KS1
  - Risk free rate 2,0 prosent
  - Risk premium 2,0 (time other travel)-2,5 per cent
- No time differentiation

#### How does it affect the results?

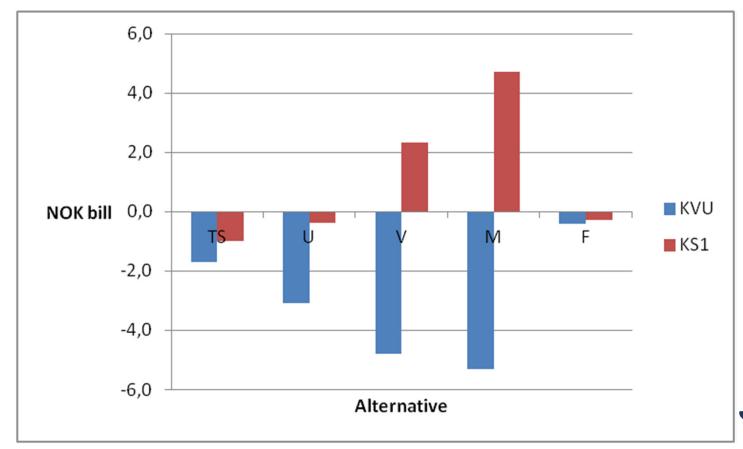

- Real price adjustment 1.4-1.6 per cent
- Volume growth 1 prosent
- In total on level with the risk premium

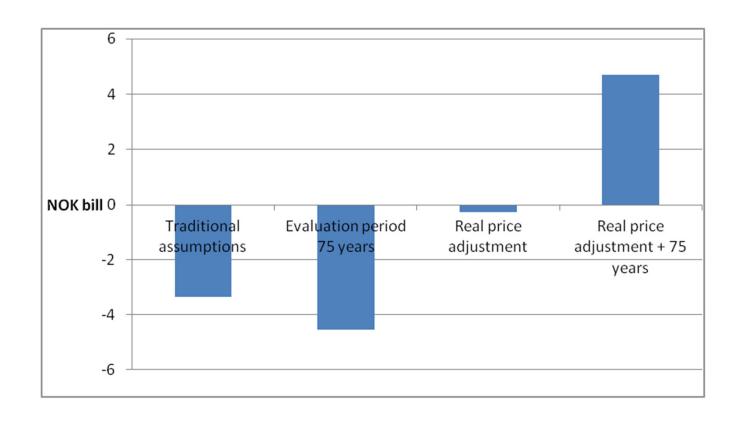

- Effective discount rate close to risk free discount rate
- The length of the evaluation period has much stronger impact than with "traditional" assumptions

#### NPV KVU and KS1

### NPV with alternative assumptions

#### Concluding remarks

- Valuation of costs and benefits at different points of time is crucial for the profitability of a project
- Discount rates, real price adjustments, valuation periods and technical lifetimes are important as separate parameters
- In combination they may be project makers or killers
- These parameters are too important to (continue to) be neglected by analysts
