NTNU Research and Innovation Program
in Digital and Automation Solutions
for the Oil and Gas Industry
BRU21 vision
Enable higher efficiency, safety and reduced environmental footprint of oil and gas production through digital and automation technologies.

BRU21 mission
Mobilize multidisciplinary expertise across NTNU and, in cooperation with industrial partners, produce research results for novel technological and organizational solutions.

BRU21 goal
Deliver new knowledge, technologies, innovations and multidisciplinary specialists for the digital transformation of the Oil and Gas industry and for Norwegian society.

“We regard BRU21 as an innovative and exciting model for collaboration between the industry and NTNU”
- Tor Ulleberg, Equinor

“The knowledge that my work may be utilized for something real is a great motivator in my everyday work”
- Mathilde Hotvedt, BRU21 PhD candidate
Foreword

BRU21 is NTNU’s Research and Innovation Program in Digital and Automation Solutions for the Oil and Gas Industry. We combine digital and domain expertise to tackle tough challenges from our industrial partners and explore the possibilities within the digital transformation of the industry. It is very important for us to efficiently transfer the obtained knowledge to the industry. To communicate our research, we have made a series of short videos describing BRU21 projects, results and their potential value.

In this booklet you will find QR codes with links to videos from the BRU21 program areas:

Exploration efficiency

Prototyping future geoscience data organization and analytics tools for improved exploration workflows

- Automated lithology classification employing whole core CT scans
- Automatic depth matching of well log data
- Rapid downhole testing of permeability anisotropy
- Automated detection of geological unconformities
- Machine learning and seismic data analysis
- Machine learning and wellbore data analysis

www.ntnu.edu/bru21/ee
Field development and economics

Developing smart methods for planning and development of offshore fields with high economic value and lower environmental footprint

Staged development enables getting more value out of small discoveries

Decision support in early field development using mathematical programming

Methods to plan environmentally friendly offshore fields

Short-term optimization under uncertainty in the Norwegian natural gas system
Drilling and well

Digital and automation solutions for reduced cost, environmental footprint and increased safety of Drilling and Well operations

- Digitalization/automation of life-cycle well integrity
- Safe drilling in karstified carbonates
- Real-time drilling optimization through continuous micro-testing
- Automatic real-time surveillance of drillstring vibrations
- Intelligent data analytics for offshore well integrity and life cycle management
- Real-time fault and symptoms detection in drilling operations with wired pipe

NTNU Drillbotics team
Reservoir management and production optimization

Modelling and optimization of reservoir and production systems – handling uncertainties and unlocking value with Big data and smart analytics

Numerical geo-steering using neural networks on a reservoir model

An improved method for optimal gas-lift allocation using automatic well testing

Improving the management of produced water in the Draugen field

Improved technology for production optimization, with focus on gas lift allocation

Data-driven reservoir modelling

Assisted history matching for petroleum reservoirs

Virtual metering using hybrid modelling; predicting choke performance in Edvard Grieg wells
Operations, maintenance, safety and security

Digital and automation solutions for optimized maintenance, improved safety and reliability and higher security levels

Industry 4.0 and Smart Predictive Maintenance

Predictive maintenance: Optimization of testing strategy for Emergency Shutdown Valves

Subsea leak detection and localization

Predictive maintenance and residual useful lifetime prediction

Risk-based maintenance

Maintenance optimization in remote operations

Underwater authentication using acoustic communication and the JANUS standard

Extending the lifetime of Norwegian oil installations using predictive maintenance

Operations, maintenance, safety and security drill and well exploration efficiency
New business and operational models

Organizational and technological preconditions for the realization of the digitalization and Industry 4.0 potential

Digital transformation in oil and gas exploration: organizational pre-conditions and implementation roadmap

An operational model for remote operations that improves safety and reliability

Preconditions, implementation and exploitation of knowledge collaboration in a complex organization

Socio-technical aspects of collaboration with digital tools in early stage design of offshore facilities
Aker BP’s ambition is to build the leading independent E&P company and digitalization is a key component in this strategy. Our digital vision is to digitize the value chain from exploration and abandonment. With strong commitment and support from owners and top management, Aker BP is transforming core end-to-end processes.

Through the BRU21 program, Aker BP is able to support and leverage world class interdisciplinary research at NTNU that is aligned with specific business needs and company strategic priorities. Topics being explored through the program include subsurface understanding, improved maintenance schemes and reduced emission. In addition, the BRU21 program offers an opportunity for Aker BP to contribute to the development of digital and interdisciplinary talent that will be needed to transform the O&G industry.”

Kristin Moe Elgsaas, AkerBP, Technology Manager, Concept Development & Technology

OKEA has supported the BRU21 program at NTNU since it was initiated in 2018. The technical focus on digitalization and automation addresses important opportunities for the oil and gas industry. Our use cases were defined on the background of actual problems that we are facing in development projects and operations. The research work is carried out in close collaboration between us, the PhD candidates, and their supervisors at NTNU. The results from these projects are therefore expected to directly add value to our business. In addition to addressing highly relevant topics, the BRU21 program has a strong focus on education. This has allowed us to attract highly skilled young professionals, whom we are proud to support, inspire and collaborate with. We are pleased to announce that one of our use cases is likely to result in a commercial product that we eventually can integrate in our workflows.”

Thomas Lerdahl, OKEA, VP Reservoir and Production Technology

We regard BRU21 as an innovative and exciting model for collaboration between the industry and NTNU. We participate in educating the next generation of petroleum technologists with digitalization «under their skin» on top of addressing critical challenges for the future.

Digitalization is a necessary enabler inherent in most future value creation. Our fields of interest range from subsurface technology to risk-based maintenance, remote operations, future operation models and cyber security. Through our participation in BRU21 we contribute to competence development and innovation and thus high value creation in the future.”

NTNU Drillbotics Team 2021
Winners of International SPE Drillbotics Competition

Preparing future industry specialists with both digital and petroleum expertise is one of the BRU21 goals.

NTNU team of drilling engineering and cybernetics students – Benedicte Gjersdal, Gaute Hånsnor, Mikal Viga Skretting and Magnus Steinstø – developed a miniature robotic drilling rig for autonomous directional drilling and won the 2021 SPE Drillbotics competition in drilling automation. Coached and sponsored by BRU21, NTNU teams won the competition also in 2018 and took 2nd place in 2017.
